

WHAT IS CLAIMED IS:

1. A handle of a rotisserie used in barbecue, comprising
  - a handle part having a middle hole at a first end portion, and a
  - 5 plurality of through holes extending from an outer side to an inner side to communicate with the middle hole;
  - engaging beads each movably held in one of the through hole of the handle part; the beads being capable of partially projecting into the middle hole of the handle part; and
  - 10 a tube passed around the first end portion of the handle part; the tube having an annular slope on an inner side of an outward end thereof; the tube being biased to an active position by means of an elastic element where an inner side thereof next to the annular slope is around outer ends of the through holes of the handle part to force
  - 15 the beads to partially project into the middle hole; the beads being allowed to move away from the middle hole when the tube is slid on the handle part against elasticity of the elastic element until the annular slope faces the outer ends of the through holes;
  - whereby the handle can be joined to a rotary support of the rotisserie
  - 20 by means of closely fitting a first end of the rotary element into the middle hole; the tube forcing the engaging beads to project into the middle hole to stay on an annular trench of the first end of the rotary support, thus preventing the handle from separating from the

rotary support; the beads being movable away from the annular trench to make the handle separable from the rotary support after the tube has been moved so that the annular slope faces the outer ends of the through holes.
